Course Automation Tool

Setup & User Guide (CAT)

A step-by-step guide to installing CAT, converting your storyboards, and importing course content into LEAP — no typing required, just copy and paste.

Prepared for the Content Development Team

1. Overview — What Is CAT?

CAT (Course Automation Tool) is the tool our team uses to take a finished course storyboard (a Word document) and automatically build that course inside LEAP. Instead of a Course Production Specialist manually copying and pasting every slide, question, and answer choice one at a time into LEAP, CAT reads the storyboard, organizes everything into the correct structure, and then places that content into the matching lesson inside LEAP for you.

CAT is made up of two parts that work together:

1. **The Conversion Step** — CAT reads your storyboard and turns it into an organized package of content behind the scenes. You never have to open or edit this package yourself.
2. **The Import Step** — CAT then opens LEAP in an automated browser window and places that content into the correct lessons, slide by slide, exactly the way you would have done it by hand — just much faster and without any copy/paste on your part.

> **This guide covers ONE tool: CAT**
> CAT is the only tool used for importing a full storyboard into LEAP. If you've also used a separate tool that pulls only Sequential and Final Exam Questions (SEQ/FEQ) into a spreadsheet, that is a **different, independent tool** and is not covered in this guide. CAT does not currently handle that exam-question export process.

CAT runs on your own computer — nothing is installed on a shared server, and nothing you do in CAT is visible to anyone else on the team unless you share your files with them.

2. What You'll Need

Before you install or run CAT, make sure you have the following:

- A Windows or Mac computer with permission to install software (if your computer is company-managed and locked down, contact IT before starting)
- A modern web browser — Google Chrome or Microsoft Edge are recommended
- Your login access to LEAP
- The finished storyboard(s) you want to import, saved as a Word `.docx` file
- The CAT tool files, provided to you by your team (a folder you'll place on your computer)
- Node.js — a free program CAT needs in order to run. You do not need to know what this is or how it works; the installation steps below walk you through it

> **Before you import anything**
> The lesson(s) you're importing into must already exist inside LEAP. CAT places content into lessons that are already there — it does not create new lessons for you. If the lesson isn't in LEAP yet, create it first, then run your import.

3. Installing CAT (Windows & Mac)

These steps only need to be done **once** per computer. After CAT is installed, you'll just start it up each time you need it (Section 4).

Step 1: Install Node.js

1. Go to `nodejs.org` in your browser.
2. Click the button for the **LTS version** (this stands for "Long Term Support" — it's the stable, recommended version). This is the correct button for both Windows and Mac; the site automatically gives you the right download for your computer.
3. Open the downloaded installer file and click through the setup wizard, accepting the default options at each screen.
4. When installation finishes, restart your computer. This step is easy to skip but important — CAT will not work correctly until you do.

> **Mac users**
> The installer file will be a `.pkg` file. Double-click it, and if your Mac shows a security warning, go to **System Settings > Privacy & Security** and click **Open Anyway** next to the blocked item. Everything else in this step is the same as Windows.

Step 2: Download the CAT tool files from GitHub

1. Go to `https://github.com/jware1989/Leap-Automation/tree/agent-testing` in your browser.
2. Click the green **Code** button near the top of the page.
3. In the menu that opens, click **Download ZIP**. This downloads the entire CAT folder as a single compressed file.
4. Find the downloaded `.zip` file (usually in your Downloads folder) and move it somewhere easy to find, such as your Desktop or Documents folder.
5. Right-click the `.zip` file and choose **Extract All** (Windows), then confirm. This unpacks it into a regular folder you can open.

> **Mac users**
> After clicking **Download ZIP**, double-click the downloaded file in your Downloads folder to unpack it — Mac does this automatically without needing an "Extract" step.

> **You will only do this once**
> Once Node.js is installed and you have the CAT folder saved on your computer, you will not need to repeat this section again — the next time you want to use CAT, skip straight to Section 4. If your team ever sends you an updated version of CAT, just repeat this step and replace the old folder with the newly downloaded one.

4. Starting CAT and Keeping It Running

Starting CAT is a single double-click. A small background window will pop up when you do this — that's normal, and it needs to stay open the whole time you're using CAT (more on that below).

Step 3: Double-click the start file

1. Open the CAT folder you downloaded and extracted in Section 3.
2. Find the file named **start** (on Windows it will show as a Windows Batch File; you may see it as `start.bat`).
3. Double-click it.
4. A dark background window will briefly appear and some text will scroll by — this is CAT starting up. After a few seconds, your default web browser will open automatically to the CAT dashboard.

Mac users

Double-click the same **start** file. If your Mac opens it in a text editor instead of running it, right-click the file, choose **Open With > Terminal**, and confirm. If you get a security warning the first time, go to **System Settings > Privacy & Security** and click **Open Anyway**. Once you've done this once, double-clicking will work normally after that.

Leave the background window open

That dark window that pops up is running the CAT server. As long as it's open, CAT is available in your browser. If you close it, CAT stops running and the dashboard will no longer load, even if you still have the browser tab open. You can minimize it, but do not close it while you're working in CAT.

Accidentally closed the browser tab?

No problem — as long as that background window is still open and running, just open a new browser tab and go to `http://localhost:3000/` to get your dashboard back. You do not need to double-click start again.

5. The Full Workflow, Step by Step

Here is the complete process from storyboard to imported course, start to finish.

Before you begin

- Confirm the lesson(s) you're importing into already exist in LEAP.
- Confirm your storyboard's headings follow the required formatting (see Section 6) — this is the single most common source of missed or skipped slides.
- Have your LEAP login ready.

Step-by-step

1. **Start CAT** by double-clicking the start file (Section 4) and letting the dashboard open at `http://localhost:3000/`.
2. **Upload your storyboard.** On the dashboard, use the upload area to select your finished `.docx` storyboard file.
3. **Let CAT convert it.** CAT will read through the entire document and organize it into units, lessons, and slides behind the scenes. This normally takes just a few seconds.
4. **Review the results.** CAT will show you a summary of everything it found, along with any warnings for slides it couldn't fully read. If anything is flagged, fix it in the storyboard and re-upload (Section 9) before moving on.
5. **Log in to LEAP when prompted.** When you start the import, CAT will open an automated browser window and may ask you to log in to LEAP the first time.
6. **Start the import.** CAT will go lesson by lesson, slide by slide, placing your storyboard's content into LEAP automatically. You'll see a running log on the dashboard showing progress in real time.
7. **Check the finished lessons in LEAP.** Once the import finishes, open the lessons in LEAP and do a quick pass to confirm everything looks right, especially any tables, images, or custom-formatted content.

> **Downloading the package file**
> You do not need to download anything as a normal part of this workflow — CAT hands the converted content straight to the import step for you. The only time you'll see a download offered is if something goes wrong partway through (such as a connection issue), in which case CAT will offer you a downloadable copy of the converted package so no work is lost and the import can be resumed or re-run.

> **Don't close the automated browser window**
> While the import is running, an automated browser window will be doing the work of placing content into LEAP. Let it run without clicking into it or closing it, the same way you wouldn't interrupt someone typing while they're mid-sentence.

6. Formatting Your Storyboard So CAT Can Read It

CAT finds slides and questions by looking for specific heading styles and wording patterns in your Word document — the same way you would recognize a new slide by its heading when reading the storyboard yourself. If a heading is typed in the wrong style, CAT may not recognize it as a heading at all, and will skip that slide's content entirely, often without any obvious error.

This is the #1 cause of missed slides

A heading that looks correct on the page (bold, larger text) but was never actually set to the right Word Heading style will be treated as regular paragraph text by CAT, not as a slide heading. Always check the Word style dropdown or the Styles pane, not just the visual appearance.

Required heading levels by section

Storyboard Element	Required Word Style	Example Text
Unit	Heading 2	Unit 1: Introduction to Valuation
New Lesson	Heading 3	New Lesson: The Cost Approach
Text Slide	Heading 4	Text Slide: Overview of the Cost Approach
Multiple Choice question	Heading 4	Inquiry: Multiple Choice: Key Terms
True/False question	Heading 4	Inquiry: True/False: Depreciation Basics
Matching exercise	Heading 4	Inquiry: Matching: Match the Definitions
Sorting exercise	Heading 4	Inquiry: Sorting: Categorize the Costs
Student Poll	Heading 4	Inquiry: Student Poll: Your Experience
Complete the Story	Heading 4	Inquiry: Complete the Story: Case Scenario
Survey	Heading 4	Inquiry: Survey: Course Feedback
Branching	Heading 4	Inquiry: Branching: Choose Your Path
Forum	Heading 4	Inquiry: Forum: Discussion Question
Key Points	Heading 4	Key Points

Example of what breaks

A slide heading typed as `Text Slide: Overview of the Cost Approach` but formatted as Heading 1 (or as plain, unstyled text that's just been bolded and enlarged to look like a heading) will not be recognized by CAT. The slide will be skipped, and depending on where it falls, its content may either be dropped or accidentally attached to the slide before or after it.

Other formatting notes

- Keep the exact wording shown above (for example, "Inquiry: Multiple Choice:") — this label is what tells CAT which slide type to build in LEAP.
- Any developer or author notes in your storyboard (Glossary Term callouts, Graphic Details for Conversion, Resources blocks, ALT TEXT notes, transcript references, and similar) are automatically recognized and left out of the imported content — you do not need to delete these yourself before uploading.
- Tables that are part of the actual slide content (not author notes) are preserved and imported as tables in LEAP.

7. Adding Raw HTML to a Storyboard

Some slides need custom formatting beyond what a normal Word document can produce — for example, an accordion-style expandable section, or custom-styled boxes. For these cases, you can paste raw HTML and CSS directly into the storyboard as plain text, and CAT will detect it automatically and carry it through to LEAP exactly as written.

> **No special markers needed**
> You do not need to wrap your HTML in any special brackets or tags to flag it — CAT automatically recognizes raw HTML wherever it appears in a slide's content, even if it comes after regular paragraph text.

What you're responsible for

Because CAT imports your HTML exactly as written, it is important that the HTML you paste in is **complete and correctly closed**. CAT does not fix or complete broken HTML for you — if a tag is left open, the slide can import looking broken in LEAP (for example, formatting that "leaks" into the rest of the page, or content that doesn't display at all).

> **Common mistake**
> Pasting an opening tag like `<p>` without its matching closing tag `</p>` is the most common way an HTML block breaks on import. Before pasting your HTML into the storyboard, do a quick check that every tag you opened has a matching closing tag.

Example

Here's an example of a properly formed HTML block as it would appear pasted into a storyboard, directly under a Text Slide heading:

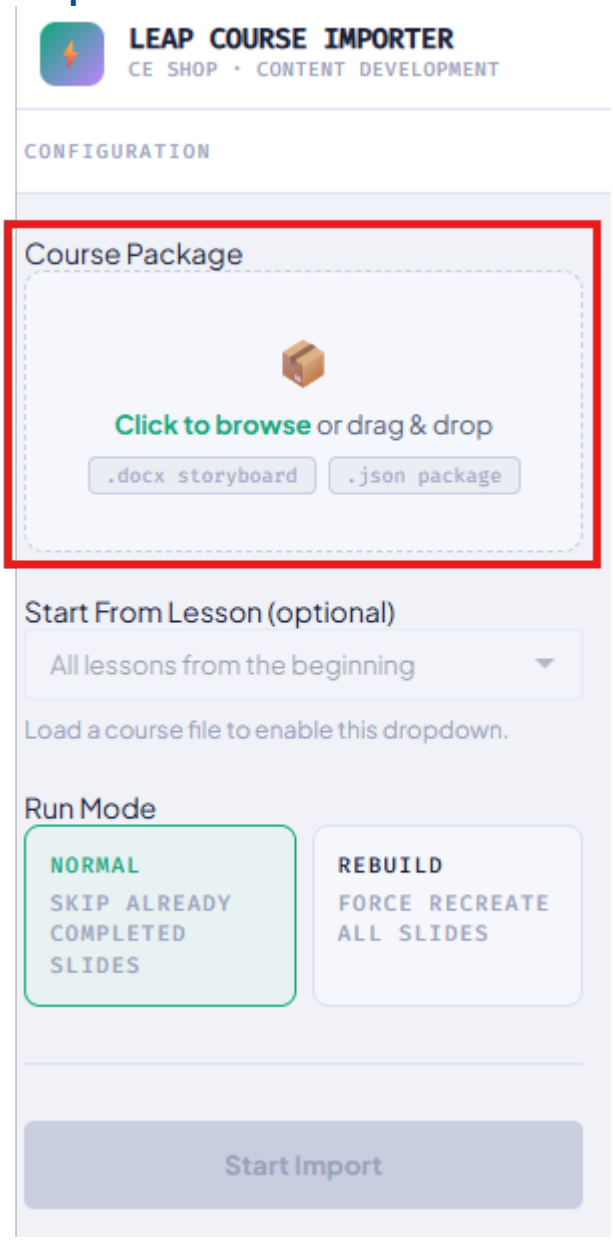

```
<style>
.cost-accordion { border: 1px solid #ccc; border-radius: 6px; }
.cost-accordion h3 { background: #f0f0f0; padding: 8px; margin: 0; }
</style>
<div class="cost-accordion">
  <h3>Click to Expand</h3>
  <p>This is the expandable content for the accordion section.</p>
</div>
```

Notice that every opening tag (`<style>`, `<div>`, `<h3>`, `<p>`) has a matching closing tag. This is what CAT needs to see in order to import the block correctly.

8. Reading the CAT Dashboard

This section walks through the main parts of the dashboard screen so you know what you're looking at.

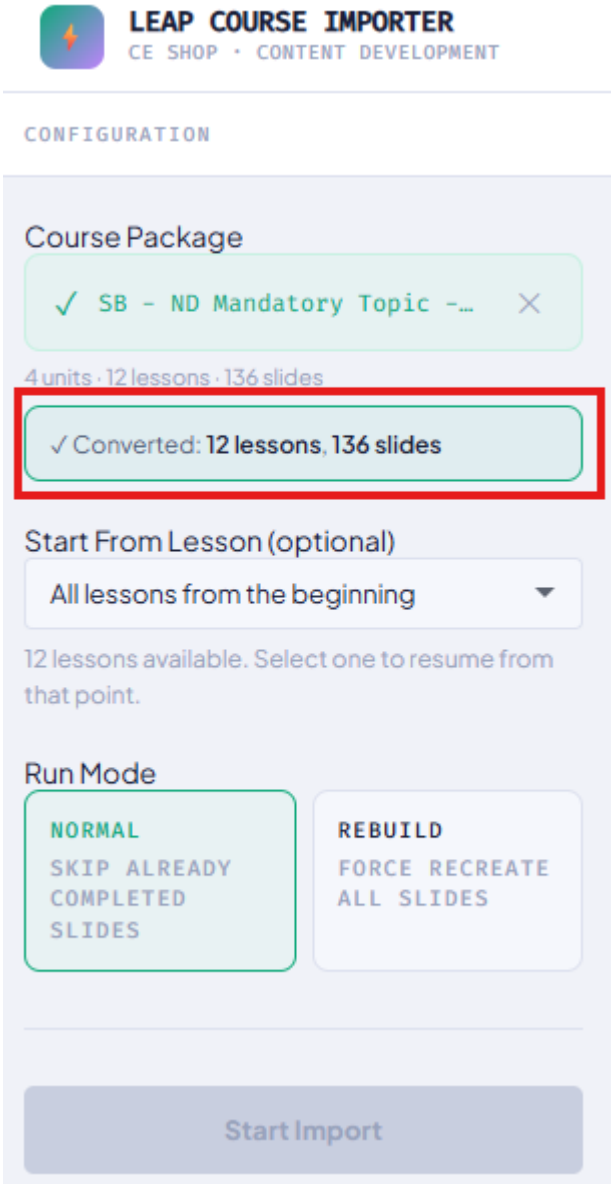

Upload area

This is where you select or drag in your storyboard `.docx` file to begin conversion.

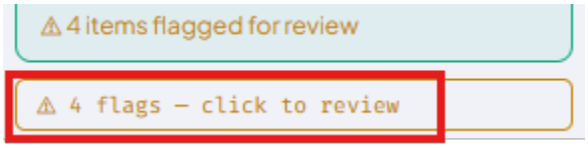

Conversion summary

8. Reading the CAT Dashboard

After your storyboard is uploaded, this panel shows how many units, lessons, and slides of each type CAT found. Use this as a quick sanity check against what you expect to see — if a lesson is missing from the "**Start From Lesson**" dropdown menu go back and check the lesson title header.

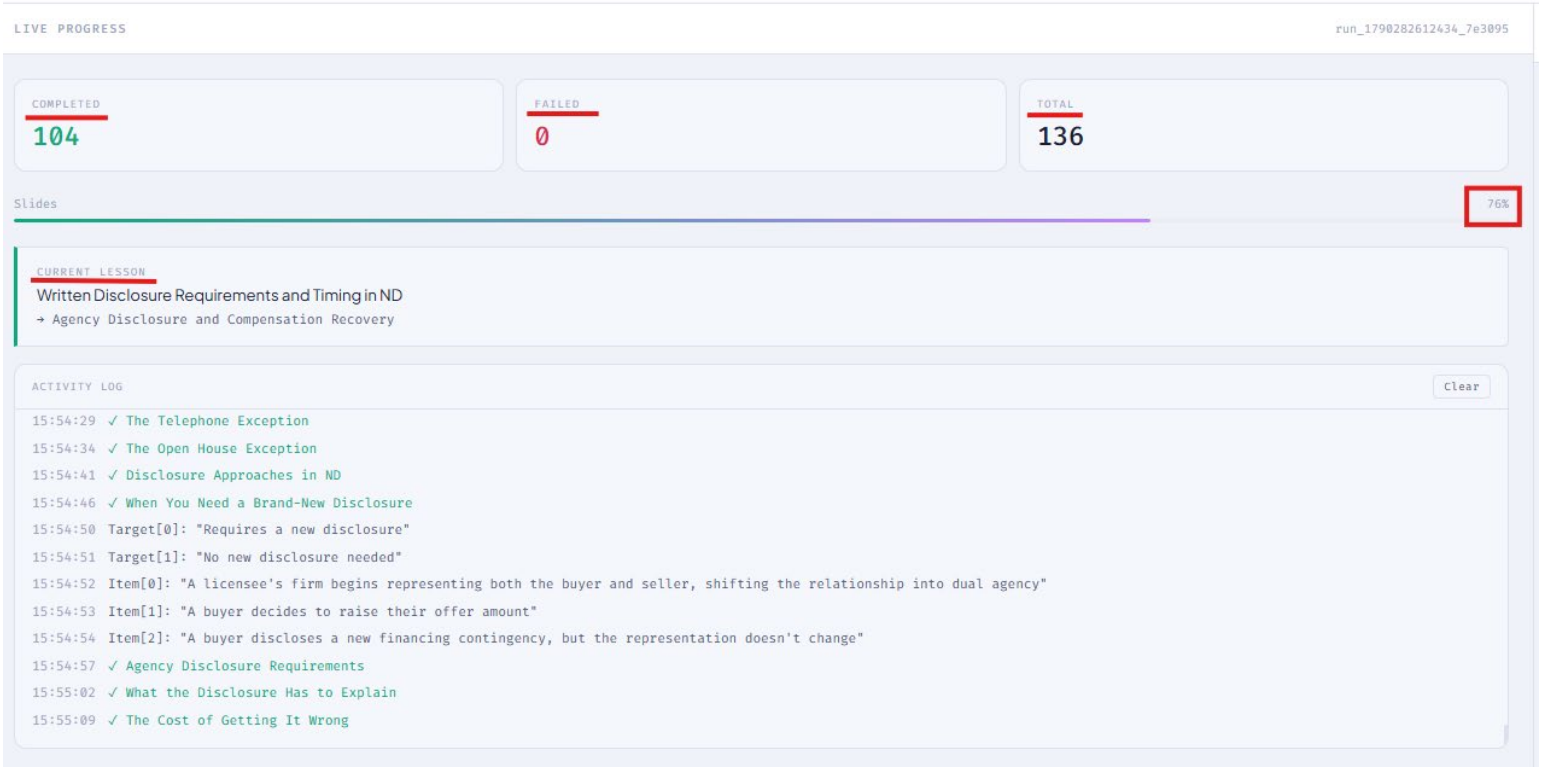

Review / flagged items panel

This panel lists anything CAT flagged during conversion — a missing answer, an unrecognized heading, and so on — along with which slide or lesson each issue belongs to. This panel tells you *what* to fix and *where*; the fix itself happens back in your storyboard, not on this screen. See Section 9 for how to act on what's listed here and Section 10 for what each warning label means.

Import log

8. Reading the CAT Dashboard

Once you start the import, this area fills in real time as CAT works through each slide, so you can follow along with exactly what's happening and confirm nothing has stalled.

Completed: This shows the amount of slides that have been created.

Failed: This shows the amount of slides that failed during the run.

Total: This is the total slides in the full storyboard. (This includes the slide types the import tool will skip)

Progress bar: Shows the % complete of the import run.

Current Lesson: Shows the current lesson and slide being created.

9. Using the Review Tool to Fix Flagged Slides

The Review Tool tells you exactly what CAT couldn't fully read and where to find it — but the actual correction is made back in your original storyboard, not on the dashboard itself. CAT reads your Word document, it doesn't edit it, so any fix has to happen in the source file and then be re-uploaded.

1. After conversion, look at the flagged items panel (Section 8) — each flagged slide is listed with a short warning label describing the issue, along with which lesson and slide it belongs to.
2. Open your original storyboard `.docx` file in Word.
3. Find the slide named in the flag and make the correction there — for example, applying the correct Heading style, filling in a missing answer, or adding the missing category row (see Section 10 for what each warning label is telling you to look for, and Section 6 for the exact formatting each slide type needs).
4. Save the storyboard in Word.
5. Back on the CAT dashboard, remove the old copy of the file you uploaded, then upload the corrected storyboard in its place.
6. Let CAT convert it again. If the issue was fixed correctly, that warning will no longer appear in the flagged items list.
7. Repeat for any remaining flagged items until the list is clear, or until you've confirmed the remaining flags are safe to leave (see Section 10 for guidance on specific warnings).

> **You don't have to fix everything**
> Some warnings are informational rather than blocking — for example, a true/false question with only one question stem. When in doubt about whether a flagged item is safe to leave, check Section 10 or ask a teammate before running the import.

10. Common Warning Labels & How to Fix Them

Warning Label	What It Means	How to Fix It
Question body not detected	CAT found the question heading but couldn't find the actual question text underneath it.	Check that the question text sits directly under the heading in the expected row/position, and that the heading style is correct (see Section 6).
No correct answer marked	None of the answer choices were marked as correct in the storyboard table.	Open the storyboard and confirm the correct answer's marker cell (usually an "x") is filled in for exactly one choice.
No drop target categories detected	A Sorting exercise was found, but CAT couldn't identify the category names items should be sorted into.	Check that each category is listed in its own labeled row, following the same layout as other working Sorting slides.
Heading style mismatch	CAT found text that looks like a slide heading, but it isn't formatted with the required Word Heading style.	Select the heading text in Word and apply the correct Heading style from Section 6.
Duplicate slide title	Two or more slides in the same lesson share the exact same heading text.	This is usually fine — CAT will keep each occurrence's own content separate. Only worth checking if the imported order of these slides looks off.
Empty content block	A slide heading was found, but no usable content followed it before the next heading.	Confirm content wasn't accidentally left in a different section, and that a stray blank heading wasn't left behind during editing.
Unrecognized raw HTML	CAT found what may be an HTML/CSS block but could not confirm it's well-formed.	Check that every opening HTML tag in the block has a matching closing tag (see Section 7).

11. What CAT Can Do Right Now

As of this guide, CAT supports converting and importing the following slide and question types:

- Text Slides (including tables and custom raw HTML/CSS content)
- Multiple Choice
- True/False
- Matching
- Sorting
- Student Poll
- Complete the Story
- Survey

> **Not currently supported**
> Branching, forum and key points.

CAT preserves genuine content tables, strips out author/developer notes automatically, and carries forward custom HTML formatting exactly as written (see Section 7). It requires that the lesson already exist in LEAP before importing content into it.

12. Troubleshooting & FAQ

I accidentally closed the browser tab. How do I get the dashboard back?

As long as the dark background window is still open, just open a new browser tab and go to `http://localhost:3000/` again. Nothing is lost.

I closed the background window by mistake. Now the dashboard won't load at all.

That window needs to stay open the whole time you're using CAT — closing it stops CAT completely. Just double-click the **start** file again (Section 4) to relaunch it.

Do I need to keep the background window visible on my screen?

No, you can minimize it. Just don't close it while you're working in CAT.

My import failed partway through. Did I lose my work?

No. If something interrupts the import, CAT will offer you a downloadable copy of the converted content so you can resume or re-run the import without starting over from your storyboard.

A whole slide is missing from LEAP after the import. What happened?

This is almost always a heading formatting issue. Check that the slide's heading in your original storyboard uses the exact required Word style and wording from Section 6, then re-run the conversion.

Can I import the same storyboard twice without creating duplicate content?

Re-running an import into a lesson that already has content from a previous import can create duplicates. If you need to make a correction, it's best to fix the content directly in LEAP for a small change, or check with your team lead before re-importing a full lesson.

The lesson I'm importing into doesn't show up / CAT can't find it.

Confirm the lesson has already been created inside LEAP under the correct unit before starting your import — CAT places content into existing lessons, it does not create new ones.

My raw HTML block imported looking broken in LEAP.

Double-check every HTML tag you pasted into the storyboard has a matching closing tag (Section 7). A single missing closing tag, like a stray `<p>` without its `</p>`, is the most common cause.

Do I need to know how to code to use CAT?

No. Everything in this guide is copy/paste and clicking through the dashboard. The only exception is if you're intentionally adding custom raw HTML/CSS for advanced formatting (Section 7), which does require some familiarity with HTML.

I fixed the issue in my storyboard, but the same warning is still showing.

Double check that you actually removed the old uploaded file and re-uploaded the saved, corrected version, not the original. Also confirm the fix was saved in Word before re-uploading — a common mistake is editing the document but closing it without saving.

Where do I get help if something isn't covered in this guide?

Reach out to your team lead or the person who provided you with the CAT tool files.

13. Appendix: Quick Reference

Quick start (after first-time installation)

1. Open the CAT folder and double-click the **start** file.
2. Wait for your browser to open automatically to the dashboard (or go to `http://localhost:3000/` yourself).
3. Upload your storyboard and review any flagged items.
4. If anything is flagged, fix it in the storyboard in Word, save, remove the old upload, and re-upload the corrected file.
5. Log in to LEAP if prompted, then start the import.
6. Confirm the finished lessons in LEAP.

Required heading styles, at a glance

Element	Style
Unit	Heading 2
New Lesson	Heading 3
Text Slide / any Inquiry / Key Points	Heading 4

Key reminders

- Keep the dark background window open the entire time you're using CAT.
- Lessons must already exist in LEAP before you import into them.
- SEQ/FEQ exam question extraction is a separate tool, not CAT.
- Raw HTML you paste in must be complete and properly closed — no special markers needed.
- Flagged issues are fixed in the storyboard itself, then re-uploaded — not edited on the dashboard.
- Bookmark `http://localhost:3000/` for quick access any time the tab closes.

End of guide.
